BASIC-ABSTRACT:

Process comprises reacting a metallic amide with a protective erythronolactone is hydroxy gps. at 2- and 3-posns. and then eliminating the protective gp. of hydroxy gps. from the resulting 4-aminoerythro-2,3-dihydroxybutyric acid being protected. The protected 4-aminoerythro-2,3-dihydroxybutyric acid can also be prepd. by reacting a metallic azide with the protected erythronolactone in hydroxy gps. at 2- and 3-posns. and then reducing the resuling cpd. in the presence of Pd-C or Raney nickel. The prod. is a novel amino acid which is obtd. by decompsn. of lentinacin being a component of shiitake(mushroom).
